

# TIS Presentation

We can use the typical Markdown syntax and every time we would like to create a new slide we just have to insert the 3 dashed ' --- ' at the end of our slide.

In the header comment section we are able to configure global and local directives which can control:

- pagination
- background color
- text color
- enable HTML tags in our presentation
- header and footer content

## Second slide

We can customize slides individually from the global scope, we can use local scope directives, to use the local scope just start the property name with a '\_', for example:

- pagination can be turned off on slides (`_paginate: false`)
- header and footer content can be changed (`_header` and `_footer`)
- background related color or image
- font color
- custom directives written in Javascript

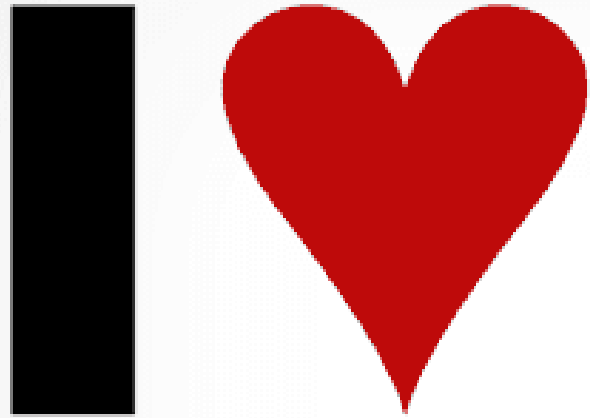

# CSS support

Marp has a wide variety of CSS support which can be found [here](#)

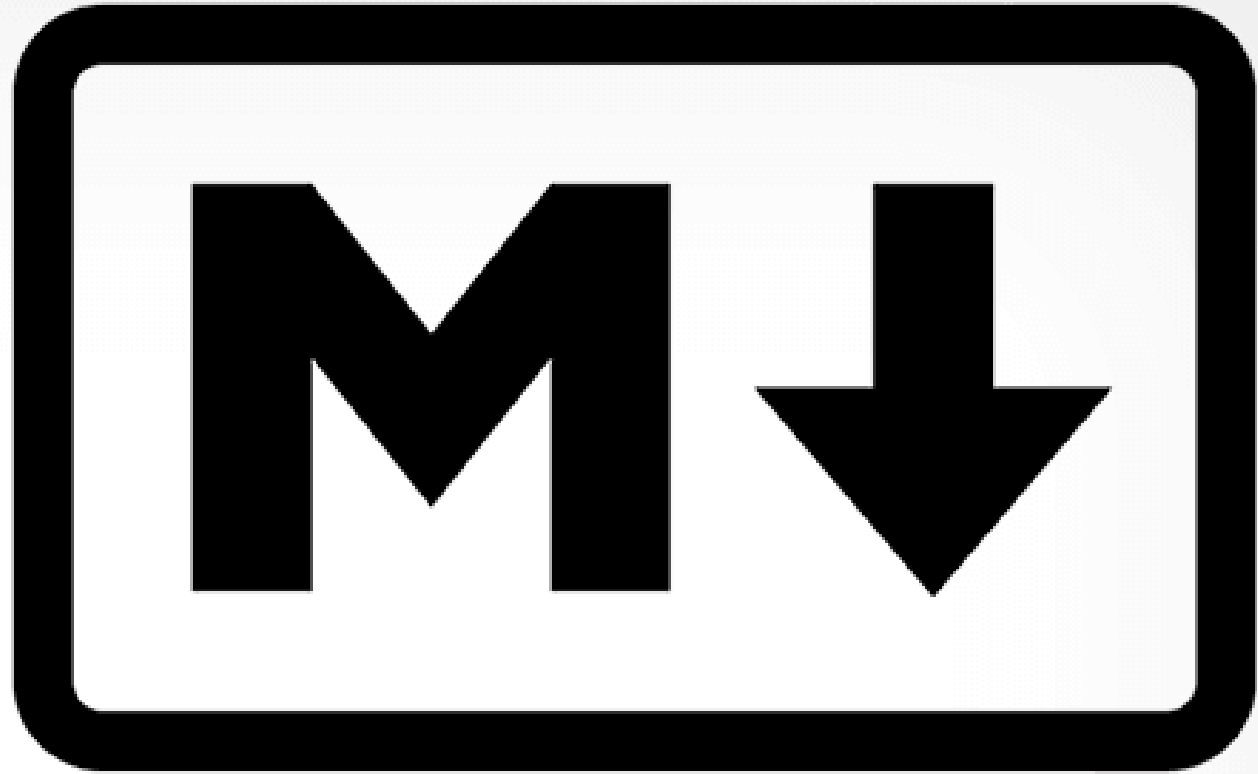

## Presenter note

During the presentation we can make some presenter note for ourselves, which will only be shown to the presenter. To make it we just have to place the note into a comment tag like this:

Background image support

We all love Markdown

# MARKDOWN

Multiple backgrounds with splitting

A

B

C

# And many more

Check out the [Marp](#) website to know more.
